

Oxaliplatin (ox-AL-IP-PLA-in) Injection, USP

Solution, Concentrate, or Intravenous USP

Read this Patient Information leaflet carefully before you start receiving Oxaliplatin Injection, USP. There may be new information. It will help you learn more about Oxaliplatin Injection, USP. This leaflet does not take the place of talking to your doctor about your medical condition or your treatment. Ask your doctor about any questions you have.

What is the most important information I should know about Oxaliplatin Injection, USP?

Serious side effects can happen in people taking Oxaliplatin Injection, USP, including:

- **Serious allergic reactions.** Oxaliplatin Injection, USP can cause serious allergic reactions, including allergic reactions that may cause death. Oxaliplatin Injection, USP is a platinum based medicine. Serious allergic reactions including death can occur in people who take Oxaliplatin Injection, USP and who have had previous allergic reactions to platinum medicines. Serious allergic reactions can happen within a few minutes of your infusion or any time during your treatment with Oxaliplatin Injection, USP.

Get emergency help right away if you:

- **have trouble breathing,**
- **feel like your throat is closing up,**
- **your doctor might faint** if you have any of the following signs or symptoms of an allergic reaction:
 - rash
 - flushed face
 - hives
 - itching
 - swelling of your lips or tongue
 - sudden cough
 - dizziness or feel faint
 - sweating
 - chest pain

Call your doctor right away if you have any of the following signs or symptoms of an allergic reaction:

- rash
- flushed face
- hives
- itching
- swelling of your lips or tongue
- sudden cough
- dizziness or feel faint
- sweating
- chest pain

See "What are the possible side effects of Oxaliplatin Injection, USP?" for information about other serious side effects.

What is Oxaliplatin Injection, USP?

Oxaliplatin Injection, USP is an anti-cancer (chemotherapy) medicine that is used with other anti-cancer medicines called 5-fluorouracil and leucovorin to treat people with the stage II colon cancer after surgery to remove the tumor. Oxaliplatin Injection, USP is also used with other anti-cancer medicines (advanced colon or rectal cancer (colo-rectal cancer)). Oxaliplatin Injection, USP with infusional 5-fluorouracil and leucovorin was shown to lower the chances of colon cancer returning when given to patients with stage III colon cancer after surgery to remove the tumor. Oxaliplatin Injection, USP also increases survival in patients with stage III colon cancer. Oxaliplatin Injection, USP with infusional 5-fluorouracil and leucovorin was also shown to increase survival, shrink tumors and delay growth of tumors in some patients with advanced colorectal cancer.

It is not known if Oxaliplatin Injection, USP works in children.

Who should not use Oxaliplatin Injection, USP?

- Do not use Oxaliplatin Injection, USP if you are allergic to any of the ingredients in Oxaliplatin Injection, USP or other medicines that contain platinum, Cisplatin and carboplatin are other chemotherapy medicines that also contain platinum. See the end of this leaflet for a complete list of the ingredients in Oxaliplatin Injection, USP.
- Ask your doctor if you are not sure if you take a medicine that contains platinum.

What should I tell my doctor before treatment with Oxaliplatin Injection, USP?

Before receiving Oxaliplatin Injection, USP, tell your doctor if you:

- have kidney problems
- have any other medical conditions
- have had any allergic reactions to any medicines
- are pregnant or plan to become pregnant. Oxaliplatin Injection, USP may harm your unborn child. You should avoid becoming pregnant while taking Oxaliplatin Injection, USP. Talk with your doctor about how to avoid pregnancy.
- are breastfeeding or plan to breastfeed. It is not known if Oxaliplatin Injection, USP passes into your breast milk. You and your doctor should decide whether you will stop breastfeeding or not take Oxaliplatin Injection, USP.

Tell your doctor about all the medicines you take, including prescription and non-prescription medicines, vitamins, and herbal supplements.

Know the medicines you take. Keep a list of them and show it to your doctor and pharmacist when you get a new medicine.

How is Oxaliplatin Injection, USP given to me?

Oxaliplatin Injection, USP is given to you through your veins (blood vessels).

- Your doctor will prescribe Oxaliplatin Injection, USP in an amount that is right for you.
- Your doctor will treat you with several medicines for your cancer.
- It is very important that you do exactly what your doctor and nurse have taught you to do.

- Some medicines may be given to you before Oxaliplatin Injection, USP to help prevent nausea and vomiting.
- Oxaliplatin Injection, USP is given with 2 other chemotherapy medicines, leucovorin and 5-fluorouracil.
- Each treatment course is given to you over 2 days. You will receive Oxaliplatin Injection, USP on the first day only.
- There are usually 14 days between each chemotherapy treatment course.

Treatment Day 1:

Oxaliplatin Injection, USP and leucovorin are given through a thin plastic tube put into a vein (intravenous infusion or I.V.) and given for 2 hours. You will be watched by a healthcare provider during this time.

Right after the Oxaliplatin Injection, USP and leucovorin are finished, 2 doses of 5-fluorouracil will be given. The first dose is given right away into your I.V. tube. The second dose will be given into your I.V. tube over the next 22 hours, using a pump device.

Treatment Day 2:

You will not get Oxaliplatin Injection, USP on Day 2. Leucovorin and 5-fluorouracil will be given the same way as on Day 1.

During your treatment with Oxaliplatin Injection, USP:

- It is important for you to keep all appointments. Call your doctor if you must miss an appointment. There may be special instructions for you.
- Your doctor may change how often you get Oxaliplatin Injection, USP, how much you get, or how long the infusion will take.
- You and your doctor will discuss how many times you will get Oxaliplatin Injection, USP.

The 5-fluorouracil will be given through your I.V. with a pump. If you have any problems with the pump on the tube, call your doctor, your nurse, or the person who is responsible for your pump. Do not let anyone other than a healthcare provider touch your infusion pump or tubing.

What activities should I avoid while on treatment with Oxaliplatin Injection, USP?

- Avoid cold temperatures and cold objects. Cover your skin if you must go outside in cold temperatures.
- Do not drink cold drinks or use ice cubes in drinks.
- Do not put ice or ice packs on your body.
- See "How can I reduce the side effects caused by cold temperatures?" for more information.
- Talk with your doctor and nurse about your level of activity during treatment with Oxaliplatin Injection, USP. Follow their instructions.

What are the possible side effects of Oxaliplatin Injection, USP?

Oxaliplatin Injection, USP can cause serious side effects, including:

- **Serious allergic reactions** (see "What is the most important information I should know about Oxaliplatin Injection, USP?"

HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use Oxaliplatin Injection, USP safely and effectively. See full prescribing information for Oxaliplatin Injection, USP.
Oxaliplatin Injection, USP, for intravenous use.
Initial U.S. Approval: 2002

WARNING: ANAPHYLACTIC REACTIONS
See full prescribing information for complete boxed warning.

Anaphylactic reactions to Oxaliplatin Injection, USP have been reported, and may occur within minutes of Oxaliplatin Injection, USP administration. Epinephrine, corticosteroids, and antihistamines have been employed to alleviate symptoms. (5.1)

INDICATIONS AND USAGE
Oxaliplatin Injection, USP is a platinum-based drug used in combination with infusional 5-fluorouracil/leucovorin, which is indicated for:

- adjuvant treatment of stage III colon cancer in patients who have undergone complete resection of the primary tumor, (1)
- treatment of advanced colorectal cancer. (1)

CONTRAINDICATIONS
• Known allergy to oxaliplatin or other platinum compounds. (4, 5.1)

WARNINGS AND PRECAUTIONS

- Allergic Reactions: Monitor for development of rash, urticaria, erythema, pruritis, bronchospasm, and hypotension. (5.1)
- Neurotoxicity: Reduce the dose or discontinue oxaliplatin if severe or moderate neurotoxicity occurs. (5.2)
- Pulmonary Toxicity: May need to discontinue oxaliplatin until interstitial lung disease or intravenous infusion is excluded. (5.3)
- Hematotoxicity: Monitor liver function tests. (5.4)
- Pregnancy: Fetal harm can occur when administered to a pregnant woman. Women should be apprised of the potential harm to the fetus. (5.8, 8.1)

ADVERSE REACTIONS

- Most common adverse reactions (incidence ≥ 40%) were peripheral sensory neuropathy, neutropenia, thrombocytopenia, anemia, nausea, increase in transaminases and alkaline phosphatase, diarrhea, emesis, fatigue and stomatitis. Other adverse reactions, including serious adverse reactions, have been reported. (6.1)

HOW SUPPLIED/STORAGE AND HANDLING

USP IN SPECIFIC POPULATIONS

OVERDOSAGE

DESCRIPTION

INDICATIONS AND USAGE
Oxaliplatin Injection, USP is a platinum-based drug used in combination with infusional 5-fluorouracil/leucovorin, which is indicated for:

- adjuvant treatment of stage III colon cancer in patients who have undergone complete resection of the primary tumor, (1)
- treatment of advanced colorectal cancer. (1)

CONTRAINDICATIONS
• Known allergy to oxaliplatin or other platinum compounds. (4, 5.1)

Clinical Chemistry	5-FU/LV (N=142)		Oxaliplatin (N=152)		Oxaliplatin + 5-FU/LV (N=150)	
	Grade 3/4 (%)	Grade 3/4 (%)	Grade 3/4 (%)	Grade 3/4 (%)	Grade 3/4 (%)	Grade 3/4 (%)
ALT (SGPT-ALAT)	28	3	36	1	31	0
AST (SGOT-SASAT)	39	2	54	4	47	0
Total bilirubin	22	6	13	5	13	1

Thrombocytopenia

The incidence of thrombocytopenic events in adjuvant patients with colon cancer was 6% (1.8% grade 3/4) in the infusional 5-fluorouracil/leucovorin arm and 6% (1.2% grade 3/4) in the oxaliplatin and infusional 5-fluorouracil/leucovorin arm, respectively. The incidence was 6 and 9% of the patients previously untreated for advanced colorectal cancer and previously treated patients in the oxaliplatin and 5-fluorouracil/leucovorin combination arm, respectively.

6.2 Postmarketing Experience

The following adverse reactions have been identified during post-approval use of oxaliplatin. Because these reactions are derived primarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Body as a whole:

angioedema, anaphylactic shock

Central and peripheral nervous system disorders:

loss of deep tendon reflexes, dysarthria, Lhermitte's sign, cranial nerve palsies, fasciculations, convulsion, reversible posterior leukoencephalopathy Syndrome (RPLS, also known as PRES).

Hearing and vestibular system disorders:

Infection reactions/hypersensitivity: laryngospasm

Liver and Gastrointestinal system disorders:

severe diarrhea/vomiting resulting in hypokalemia, colicis (including Clostridium difficile diarrhea), melanic acidosis; ileus; intestinal obstruction, pancreatitis; non-occlusive disease of liver also known as sinusoidal obstruction syndrome, and perisinusoidal fibrosis which rarely may progress.

Platlet, bleeding, and clotting disorders:

immuno-thrombocytopenic purpura, thrombocytopenia, thrombocytopenic purpura, thrombocytopenia, prothrombin time and of INR in patients receiving anticoagulants

Red blood cell disorders:

hemolytic uremic syndrome, immuno-allergic hemolytic anemia

Renal disorders:

acute tubular necrosis, acute interstitial nephritis and acute renal failure.

Respiratory system disorders:

pulmonary fibrosis, and other interstitial lung diseases (sometimes fatal)

Vision disorders:

decrease of visual acuity, visual field disturbance, optic neuritis and transient vision loss (reversible following therapy discontinuation)

DRUG INTERACTIONS

No specific cytotoxicity phase-3 based drug interaction studies have been conducted. No pharmacokinetic interaction between 85 mg/m² oxaliplatin and 5-fluorouracil/leucovorin has been observed in patients treated every 2 weeks. Increases of 5-fluorouracil plasma concentrations by approximately 20% have been observed with doses of 130 mg/m² oxaliplatin every 3 weeks. Because platinum-containing species are eliminated primarily through the kidney, clearance of these products may be decreased by coadministration of potentially nephrotoxic compounds; although, this has not been specifically studied (see *Clinical Pharmacology* (12.3)).

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Category D

Based on direct interaction with DNA, oxaliplatin may cause fetal harm when administered to a pregnant woman. There are no adequate and well-controlled studies of oxaliplatin in pregnant women. Reproductive toxicity was demonstrated adverse effects on fertility and embryo-fetal development at maternal doses that were below the recommended human dose based on body surface area. If this drug is used during pregnancy or if the patient becomes pregnant while taking this drug, the patient should be apprised of the potential hazard to the fetus. Women of childbearing potential should be advised to avoid becoming pregnant and use effective contraception while receiving treatment with oxaliplatin.

Pregnant rats were administered oxaliplatin at least one-half of the recommended human dose based on body surface area during gestation days 1 to 5 (pre-implantation), 6 to 10, or 11 to 16 (during organogenesis). Oxaliplatin caused developmental mortality (increased early resorptions) when administered on days 6 to 10 and 11 to 16 and adversely affected fetal growth (decreased fetal weight, delayed ossification) when administered on days 6 to 10. Administration of oxaliplatin to male and female rats prior to mating resulted in 97% and 100% pre-implantation loss in animals that received approximately one-seventh the recommended human dose based on the body surface area.

8.3 Nursing Mothers

It is not known whether oxaliplatin or its derivatives are excreted in human milk. Because many drugs are excreted in human milk and because of the potential for serious adverse reactions in nursing infants from oxaliplatin, a decision should be made to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

8.4 Pediatric Use

The effectiveness of oxaliplatin in children has not been established. Oxaliplatin has been tested in 2 Phase 1 and 2 Phase 2 trials in 235 patients ages 7 months to 22 years with solid tumors (see below) and no significant activity observed.

In a Phase 1/2 study, oxaliplatin was administered as a 43 patient intravenous infusion on Days 1, 8 and 15 every 4 weeks (1 cycle), for a maximum of 6 cycles, to 43 patients with refractory or relapsed malignant solid tumors, mainly neuroblastoma and osteosarcoma. Twenty eight pediatric patients in the Phase 1 study received oxaliplatin at 6 dose levels starting at 40 mg/m² with escalation to 110 mg/m². The dose limiting toxicity (DLT) was sensory neuropathy at the 110 mg/m² dose. Fifteen patients received oxaliplatin at a dose of 90 mg/m² intravenous on days 1, 8 and 15. At this dose, paresthesia (60%, 63/44, 7%), fever (40%, 63/44, 7%) and thrombocytopenia (40%, 63/44, 27%) were the main adverse reactions. No responses were observed.

In a second Phase 1 study, oxaliplatin was administered to 26 pediatric patients as a 2-hour intravenous infusion on day 1 every 3 weeks (1 cycle) at 5 dose levels starting at 100 mg/m² with escalation to 160 mg/m², for a maximum of 6 cycles, in a separate cohort. Oxaliplatin 85 mg/m² was administered on day 1 every 2 weeks, for a maximum of 9 doses. Patients had metastatic or unresectable solid tumors mainly neuroblastoma and ganglioneuroblastoma. No responses were observed. The DLT was sensory neuropathy at the 160 mg/m² dose. Based on these studies, oxaliplatin 130 mg/m² as a 2-hour intravenous infusion on day 1 every 3 weeks (1 cycle) was used in subsequent Phase 2 studies. A dose of 85 mg/m² on day 1 every 2 weeks was also found to be tolerable.

In one Phase 2 study, 43 pediatric patients with recurrent or refractory embryonal CNS tumors received oxaliplatin 130 mg/m² every 3 weeks for a maximum of 12 months in absence of progressive disease or unacceptable toxicity. In patients < 10 kg the oxaliplatin dose used was 4.3 mg/kg. The most common adverse reactions reported were leukopenia (67%, G3/4, 12%), anemia (65%, G3/4, 5%), thrombocytopenia (65%, G3/4, 28%), vomiting (65%, G3/4, 7%), neutropenia (58%, G3/4, 6%) and sensory neuropathy (40%, G3/4, 5%). One partial response was observed.

In a second Phase 2 study, 123 pediatric patients with recurrent solid tumors, including neuroblastoma, osteosarcoma, Ewing sarcoma or peripheral PNET, ependymoma, rhabdomyosarcoma, hepatoblastoma, high grade astrocytoma, Brain stem glioma, low grade astrocytoma, malignant germ cell tumor and other tumors of interest received oxaliplatin 130 mg/m² every 3 weeks for a maximum of 12 months in absence of progressive disease. In patients <12 months old the oxaliplatin dose used was 4.3 mg/kg. The most common adverse reactions reported were sensory neuropathy (52%, G3/4, 12%), thrombocytopenia (37%, G3/4, 17%), anemia (37%, G3/4, 9%), vomiting (26%, G3/4, 4%), ALT increased (24%, G3/4, 6%), AST increased (24%, G3/4, 2%), and nausea (23%, G3/4, 4%). Two partial responses were observed.

The pharmacokinetic parameters of ultrafiltrable platinum have been evaluated in 105 pediatric patients during the first cycle. The mean clearance in pediatric patients estimated by the population pharmacokinetic analysis was 4.7 L/h. The inter-patient variability of platinum clearance in pediatric cancer patients was 41%. Mean platinum pharmacokinetic parameters in ultrafiltrate were C₀ of 1.75 ± 0.24 mcg/mL, AUC₀₋₂₄ of 7.52 ± 5.07 mcg•h/mL, and AUC_{0-∞} of 8.83 ± 5.7 mcg•h/mL at 85 mg/m² of oxaliplatin and C₀ of 1.17 ± 0.43 mcg/mL, AUC₀₋₂₄ of 9.74 ± 2.52 mcg•h/mL and AUC_{0-∞} of 17.3 ± 5.34 mcg•h/mL at 130 mg/m² of oxaliplatin.

8.5 Geriatric Use

No significant effect of age on the clearance of ultrafiltrable platinum has been observed.

In the adjuvant therapy colon cancer randomized clinical trial, *[see Clinical Studies (14)]* 723 patients treated with oxaliplatin and infusional 5-fluorouracil/leucovorin were <65 years and 400 patients were ≥65 years.

A descriptive subgroup analysis demonstrated that the improvement in DFS for the oxaliplatin combination arm compared to the infusional 5-fluorouracil/leucovorin alone arm appeared to be maintained across ages. The effect of oxaliplatin in patients ≥65 years of age was not conclusive. Insufficient subgroup sizes prevented analysis by race.

Patients ≥65 years of age receiving the oxaliplatin combination therapy experienced more grade 3-4 granulocytopenia than patients <65 years of age (45% versus 39%). In the previously untreated for advanced colorectal cancer randomized clinical trial *[see Clinical Studies (14)]* of oxaliplatin, 160 patients treated with oxaliplatin and 5-fluorouracil/leucovorin were < 65 years and 99 patients were ≥65 years. The same efficacy improvements in response rate, time to tumor progression,

and overall survival were observed in the ≥65 year old patients as in the overall population. In the previously treated for advanced colorectal cancer randomized clinical trial *[see Clinical Studies (14)]* of oxaliplatin, 95 patients treated with oxaliplatin and 5-fluorouracil/leucovorin were <65 years and 55 patients were ≥65 years. The rates of overall adverse reactions, including grade 3 and 4 events, were similar across and within arms in the different age groups in all studies. The incidence of diarrhea, dehydration, hypokalemia, leukopenia, fatigue and syncope were higher in patients ≥65 years old. No adjustment to starting dose was required in patients ≥65 years old.

8.6 Patients with Renal Impairment

The exposure (AUC) of unbound platinum in plasma ultrafiltrate tends to increase in renally impaired patients *[see Pharmacokinetics (12.3)]*. Caution and close monitoring should be exercised when oxaliplatin is administered to patients with renal impairment. The starting oxaliplatin dose does not need to be reduced in patients with mild (creatinine clearance≥50 to 80 mL/min) or moderate (creatinine clearance≥30 to 49 mL/min) renal impairment. However, the starting dose of oxaliplatin should be reduced in patients with severe renal impairment (creatinine clearance <30 mL/min) *[see Dosage and Administration (2.2)]*.

10 OVERDOSE

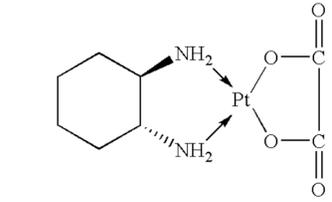

There is no known antidote for oxaliplatin overdose. In addition to thrombocytopenia, the anticipated complications of an oxaliplatin overdose include hypersensitivity reaction, myelosuppression, nausea, vomiting, diarrhea and neurotoxicity.

Several cases of overdoses have been reported with oxaliplatin. Adverse reactions observed were Grade 4 thrombocytopenia (<25,000/mm³) without any bleeding, anemia, sensory neuropathy such as paresthesia, dyesthesia, laryngospasm and facial muscle spasms, gastrointestinal disorders such as nausea, vomiting, stomatitis, flatulence, abdomen enlarged and Grade 4 intestinal obstruction, Grade 4 dehydration, dyspnea, wheezing, chest pain, respiratory failure, severe bradycardia and death.

Patients suspected of receiving an overdose should be monitored, and supportive treatment should be administered. The maximum dose of oxaliplatin that has been administered in a single infusion is 923 mg.

11 DESCRIPTION

Oxaliplatin Injection, USP is an antineoplastic agent with the molecular formula C₁₂H₁₆N₂O₄Pl and the chemical name of cis-[(1*R*,2*R*)-1,2-cyclohexanediamine-*N,N'*] oxalato(2-)-O,1] platinum. Oxaliplatin is an organoplatin complex in which the platinum atom is complexed with 1,2-diaminocyclohexane(DACH) and with an oxalate ligand as a leaving group.

The molecular weight is 397.3. Oxaliplatin is slightly soluble in water at 6 mg/mL, very slightly soluble in methanol, and practically insoluble in ethanol and acetone. Oxaliplatin is a white, crystalline solid. The decline of ultrafiltrable platinum levels following oxaliplatin administration is biphasic, characterized by two relatively short distribution phases (t_{1/2α}: 0.43 hours and t_{1/2β}: 16.8 hours) and a long terminal elimination phase (t_{1/2γ}: 391 hours). Pharmacokinetic parameters obtained after a single 2-hour intravenous infusion of oxaliplatin at a dose of 85 mg/m² expressed as ultrafiltrable platinum were C₀ = 0.814 mcg/mL and volume of distribution of 440 L.

Oxaliplatin undergoes nonenzymatic conversion in physiologic solutions to active derivatives via displacement of the labile oxalate ligand. Several transient reactive species are formed, including monoquo and diaquo DACH platinum, which covalently bind with macromolecules. Both inter- and intrastand Pt-DNA crosslinks are formed. Crosslinks are formed between the *N7* positions of two adjacent guanines (G6), adjacent adguine-guanines (AG), and guanines separated by an intervening nucleotide (GNG). These crosslinks inhibit DNA replication and transcription. Cytotoxicity is not cycle nonspecific. *In vivo* studies have shown antitumor activity of oxaliplatin against colon carcinoma. In combination with 5-fluorouracil, oxaliplatin exhibits *in vitro* and *in vivo* antiproliferative activity greater than either compound alone in several tumor models [HT29 (colon), GR (mammary), and L1210 (leukemia)].

12.3 Pharmacokinetics

The reactive oxalato derivatives are present as a fraction of the unbound platinum in plasma ultrafiltrate. The decline of ultrafiltrable platinum levels following oxaliplatin administration is biphasic, characterized by two relatively short distribution phases (t_{1/2α}: 0.43 hours and t_{1/2β}: 16.8 hours) and a long terminal elimination phase (t_{1/2γ}: 391 hours). Pharmacokinetic parameters obtained after a single 2-hour intravenous infusion of oxaliplatin at a dose of 85 mg/m² expressed as ultrafiltrable platinum were C₀ = 0.814 mcg/mL and volume of distribution of 440 L.

Interpatient and intrapatient variability in ultrafiltrable platinum exposure (AUC₀₋₂₄) assessed over 3 cycles was moderate to low (23% and 6%, respectively). A pharmacodynamic relationship between platinum ultrafiltrate levels and clinical safety and effectiveness has not been established.

Distribution
At the end of a 2-hour infusion of oxaliplatin, approximately 15% of the administered platinum is present in the systemic circulation. The remaining 85% is rapidly distributed into tissues or eliminated in the urine. In patients, plasma protein binding of platinum is irreversible and is greater than 90%. The main binding partners are albumin and gamma-globulins. Platinum also binds irreversibly and accumulates (approximately 2-fold) in erythrocytes, where it appears to have no relevant activity. No platinum accumulation was observed in plasma ultrafiltrate following 85 mg/m² every two weeks.

Metabolism

Oxaliplatin undergoes rapid and extensive nonenzymatic biotransformation. There is no evidence of cytochrome P450-mediated metabolism *in vitro*. Up to 17 platinum-containing derivatives have been observed in plasma ultrafiltrate samples from patients, including several cytotoxic species (monocholoro DACH platinum, dichloro DACH platinum, and monoquo and diaquo DACH platinum) and a number of noncytotoxic, conjugated species.

Elimination
The major route of platinum elimination is renal excretion. At five days after a single 2-hour infusion of oxaliplatin, urinary elimination accounted for about 54% of the platinum eliminated, with fecal excretion accounting for only about 2%. Platinum was cleared from plasma at a rate (10 to 17 L/h) that was similar to or exceeded the average human glomerular filtration rate (GFR, 7-11 L/h). There was no significant effect of gender on the clearance of ultrafiltrable platinum. The renal clearance of ultrafiltrable platinum is significantly correlated with GFR.

Pharmacokinetics in Special Populations

Pediatric

[See Use in Specific Patient Populations (8.4)].

Renal Impairment
A study was conducted in 38 patients with advanced GI cancer and varying degrees of renal impairment. Patients in the normal (creatinine clearance (CrCL) ≥80 mL/min, N=11), mild (CrCL=50 to 80 mL/min, N=13), and moderate (CrCL=30 to 49 mL/min, N=10) groups were treated with 85 mg/m² oxaliplatin and those in the severe (CrCL <30 mL/min, N=4) group were treated with 65 mg/m² oxaliplatin. The mean AUC of unbound platinum was 40%, 95%, and 342% higher in the mild, moderate, and severe groups, respectively, than in the normal group. Mean C₀ of unbound platinum appeared to be similar among the normal, mild and moderate renal function groups, but was 38% higher in the severe group than in the normal group. Caution should be exercised in renally impaired patients *[see Use in Specific Populations (8.6)]*. The starting dose of oxaliplatin injection should be reduced in patients with severe renal impairment *[see Dosage and Administration (2.2)]*.

Drug - Drug Interactions

No pharmacokinetic interaction between 85 mg/m² of oxaliplatin and infusional 5-fluorouracil has been observed in patients treated every 2 weeks, but increases of 5-fluorouracil plasma concentrations by approximately 20% have been observed with doses of 130 mg/m² of oxaliplatin administered every 3 weeks. *In vitro*, platinum was not displaced from plasma proteins by the following metals: calcium, calcium salicylate, sodium valproate, granisetron, and pindolol. *In vitro*, oxaliplatin is not metabolized by, nor does it inhibit, human cytochrome P450 isoenzymes. No P450-mediated drug-drug interactions are therefore anticipated in patients. Since platinum-containing species are eliminated primarily through the kidney, clearance of these products may be decreased by co-administration of potentially nephrotoxic compounds, although this has not been specifically studied.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term animal studies have not been performed to evaluate the carcinogenic potential of oxaliplatin. Oxaliplatin was not mutagenic in bacteria (Ames test) but was mutagenic to mammalian cells *in vitro* (L5178Y mouse lymphoma assay). Oxaliplatin was clastogenic both *in vitro* (chromosome aberration in human lymphocytes) and *in vivo* (mouse bone marrow micronucleus assay).

In a fertility study, male rats were given oxaliplatin at 0, 0.5, 1, or 2 mg/kg/day for five days every 21 days for a total of three cycles prior to mating with females that received two cycles of oxaliplatin on the same schedule. A dose of 2 mg/kg/day (less than one-seventh the recommended human dose on a body surface area basis) did not affect pregnancy rate, but caused developmental mortality (increased early resorptions, decreased live fetuses, decreased live births) and delayed growth (decreased fetal weight).

Testicular damage, characterized by degeneration, hypoplasia, and atrophy, was observed in dogs administered oxaliplatin at 0.75 mg/kg/day x 5 days every 28 days for three cycles. A no effect level was not identified. This daily dose is approximately one-sixth of the recommended human dose on a body surface area basis.

14 CLINICAL STUDIES

14.1 Combination Adjuvant Therapy with Oxaliplatin and Infusional 5-fluorouracil/leucovorin in Patients with Colon Cancer

An international, multicenter, randomized study compared the efficacy and evaluated the safety of oxaliplatin in combination with an infusional schedule of 5-fluorouracil/leucovorin to infusional 5-fluorouracil/leucovorin alone, in patients with stage II (Dukes' B2) or III (Dukes' C) colon cancer who had undergone complete resection of the primary tumor. The primary objective of the study was to compare the 3-year disease-free survival (DFS) in patients receiving oxaliplatin and infusional 5-fluorouracil/leucovorin to those receiving 5-fluorouracil/leucovorin alone.

Patients were to be treated for a total of 6 months (i.e., 12 cycles). A total of 2246 patients were randomized: 1123 patients per study arm. All patients in the study had had to be between 18 and 75 years of age, have histologically proven stage II (T₁₋₇, N0,M; Dukes' B2) or III (any T₁₋₇, N₀₋₁, M; Dukes' C) colon carcinoma (with the inferior pole of the tumor above the peritoneal reflection, i.e., >15 cm from the anal margin) and undergone (within 7 weeks prior to randomization) complete resection of the primary tumor without gross or microscopic evidence of residual disease. Patients had to have had no prior chemotherapy, immunotherapy or radiotherapy, and have an ECOG performance status of 0, 1, or 2 (KPS ≥60%), absolute neutrophil count (ANC) ≥1.5x10⁹/L, platelets ≥100x10⁹/L, serum creatinine <1.25 x ULN total bilirubin <2x ULN, AST/ALT <2x ULN and carcino-embryonic antigen (CEA) <10 ng/mL. Patients with preexisting peripheral neuropathy (NCI grade ≥1) were ineligible for this trial.

The following table shows the dosing regimens for the two arms of the study.

Treatment Arm	Dose	Regimen
Oxaliplatin + 5-FU/LV (FOLFOX4) (N=1123)	Day 1: Oxaliplatin: 85 mg/m ² (2-hour infusion) + LV: 200 mg/m ² (2-hour infusion), followed by 5-FU: 400 mg/m ² (bolus), 600 mg/m ² (22-hour infusion)	every 2 weeks 12 cycles
5-FU/LV (N=1123)	Day 1: LV: 200 mg/m ² (2-hour infusion), followed by 5-FU: 400 mg/m ² (bolus), 600 mg/m ² (22-hour infusion)	every 2 weeks 12 cycles
	Day 2: LV: 200 mg/m ² (2-hour infusion), followed by 5-FU: 400 mg/m ² (bolus), 600 mg/m ² (22-hour infusion)	

The following tables show the baseline characteristics and dosing of the patient population entered into this study. The baseline characteristics were well balanced between arms.

	Oxaliplatin + Infusional 5-FU/LV N=1123	Infusional 5-FU/LV N=1123
Sex: Male (%)	56.1	52.4
Female (%)	43.9	47.6
